

Long-term care for older persons: sub-Saharan African realities

Isabella Aboderin, PhD

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Outline

- Context: demographics and policy architecture
- ‘Family’ and organized care:
 - Landscape, access, quality, trends
- Promising care models?
- Quality regulation: gaps, barriers
- Ageism, rights-based approach: useful lenses, levers?

Demographics and policy architecture

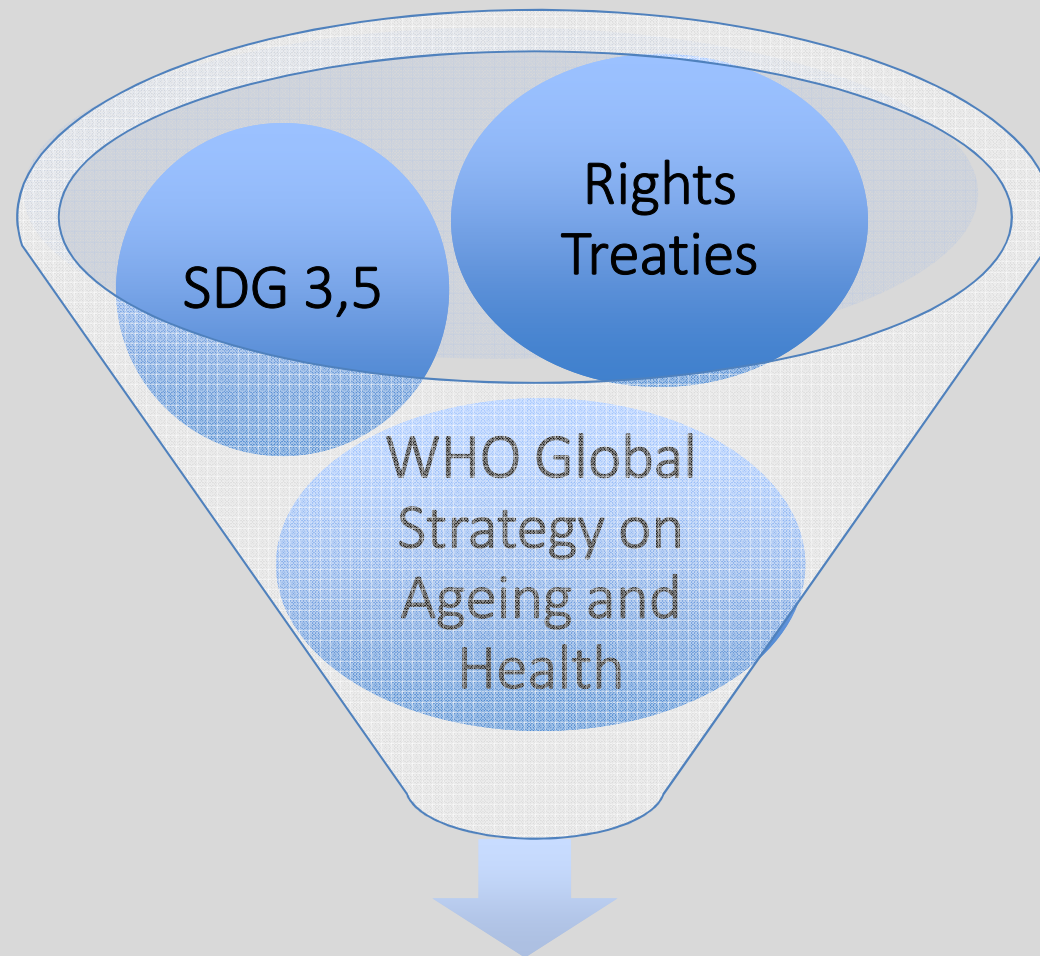

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

- Already large, rapidly rising no. of older adults: 46 million today → 165 million in 2050
 - Considerable, likely growing prevalence of functional impairment in older population
- ➔ Substantial, expanding need for LTC

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Responsive regional / national policy architecture?

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

REGIONAL

Policy frames:

AU Policy Framework
and Plan of Action on
Ageing (2002)

Rights frames:

AU Protocol on the Rights
of Older People (2016)

NATIONAL

Policy frames:

National policies on
older persons/aging

Legislation:

-Constitutions
-Older persons bills

Family care:
configurations, access, quality – trends?

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Configurations

- Mainstay of LTC provision
- Flexible format: who provides care, where varies
- Notable features:
 - Women dominate (wives, daughters (-in-law))
 - Non-trivial involvement of men
 - Role of older women, children, (migrant workers)

Access

- Non-negligible gaps:
 - Complete absence of family carer
(e.g. $\approx 19\%$ SW Nigeria (Gureje *et al.* 2006))
 - Temporary absence of family carer

Quality

- Complexity of definition
- Multiple dimensions – content, process, outcomes
(person centred, maximising role and self care of older person, ensuring dignity, well-being, optimising intrinsic capacity, maintain functional ability)
- Ambiguities? (e.g. WHO frame \Leftrightarrow cultural scripts)
- Measurement?

Quality gaps:

- Qualitative studies:
 - inconsistent, poor timing of care
 - non-consideration of older persons' wishes
 - abuse (incl. witchcraft accusations)
- Surveys:
 - Older adult eating alone
 - Lack of access to biomedical care
 - Level of hygiene ('neglect')

Impacts:

- Depression, declining functional autonomy, death
- experienced loss of dignity, autonomy

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

- Quality gaps pronounced in contexts of poverty
→ family carers' 'dilemma':

Neglect own economic activities,
opportunities? obligation to
offspring?

Neglect care, support to older kin?

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Trends ?

- Common view:
 - Declining family care with social change
- Assumed drivers:
 - rural-urban migration
 - female labor force participation
 - HIV/AIDS
 - nuclearization, loosening of extended family norms
- Need for caution:
 - theory inspired conjecture: weak empirical basis

Organized care:
landscape, trends, access, quality

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Landscape

- Largely undocumented for most of SSA
- Some indications:

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

- Mauritius, South Africa, Seychelles:
 - relatively well established, developed
- Other countries:
 - uncoordinated ‘organic’ expansion (real need / demand)
 - Two dominant service models:
 - charitable welfare care institutions
 - Private-for-profit services (institutions, HBC)
- Patchy provision thus far → wide access gaps

Access - gaps

- *Population groups served:*
 - the poorest, destitute and the affluent
 - Little / no access for broad majority
- *Geography:*
 - services clustered in urban metropolises
 - little access in small towns, rural areas
- *Type of need*
 - Little/no access for dementia sufferers

Quality

- Gaps in:
 - Delivery of person-centred care
 - Opportunities for purposeful, culturally relevant activities
 - Maximisation of role, self care of older person
 - Promotion of intrinsic capacity
 - Access to requisite medical care
- Greater deficits among charitable, welfare services

Underlying operational gaps

- Reliance on lay, often volunteer, agency staff
- Lack of:
 - Qualified staff with geriatric care skills
 - Conducive conditions for staff
 - Standard quality assurance processes
 - Basic amenities, space, hygiene, financial resources
 - Integration with medical care provision

Promising models ?

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

- Emergence of novel community-, or home-based care models that retain central family involvement
- Examples: Ghana, Kenya, South Africa, Tanzania

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Care quality regulation?

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

Policy architecture

- Virtual omission of *quality* of family, organized LTC (Focus on *who* ought to provide care)
- Partial exceptions: Mauritius, South Africa policies/bills

Government regulation:

- South Africa, Mauritius, Seychelles:
 - some public oversight, standards, monitoring
 - focus on organized care only
 - enforcement mechanisms less-well developed
- Other countries: no formal regulatory mechanisms

Debate ?

- Virtual absence of debate on quality of family, organized LTC
- Three key barriers

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

1. Cultural, political scripts:

- Family care, respect for elders part of Africa's identity:
 - Assumption of nothing 'amiss' with family LTC
 - Resistance to considering organized LTC provision

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

2. Lacking awareness

- what are purpose, ultimate aims of LTC?
- what does 'quality' LTC encompass?
- what's the evidence ?

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

3. Overriding youth-focused development (and economic growth) agenda (demographic dividend)

– Issues of LTC viewed as marginal

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

**‘Ageism’ and ‘rights-based approach’:
useful lenses, levers?**

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

- Ageism – driver of LTC quality gaps?
- Possibly limited relevance
 - Favoring of older people in other spheres (SP)
 - Interface with ‘generativity’:
priority on young in context of resource constraints

A global center of excellence, consistently generating and delivering relevant scientific evidence for policy and action

- Rights-based approach – to enhance LTC quality?
- Necessary but not sufficient
- Additional need for:
 - Awareness raising
 - Pinpointing relevance to broader youth-focused development agenda (incl. intergenerational effects)
